AB Cotton and cotton/polyester fabrics were treated against microbial attack by applying a formulation based essentially on ZnO under high-energy radiation and thermal curing. To achieve the homogeneity and the reactivity of the treating formulation, a binder (Impron MTP) and a dispersing agent (Setamol WS) were used with ZnO. The antimicrobial property of the fabrics was evaluated, in terms of mechanical properties, by a soil burial test. Moreover, the effect of antimicrobial finishing on the dyeing properties in terms of color strength was investigated. It was found that the best composition that affords the best anti-microbial protection to cotton fabrics contains 2% ZnO, 2% binder, and 1% dispersing agents. For the cotton/polyester blend, the best results were achieved at the same conditions except the ZnO was 1%. It was found that the treatment under the effect of electron-beam irradiation is better than that of gamma irradiation and thermal curing. The results showed that when the finishing process was carried out before dyeing with a reactive dye, it affects the color strength rather than performing the finishing after the dyeing process. 17 Refs.

AB The films with good **whitening** resistance after processing consist of a biaxially stretched polyester base film not contg. particles and .gtoreq.1 coating layer contg. particles, where the base film has .ltoreq.10/m2 foreign matters, i.e., raised portions with height .gtoreq.1 .mu.m and max. diam. .gtoreq.20 .mu.m and depressed portions placed .ltoreq.100 .mu.m of the raised portions and depth .gtoreq.0.5 .mu.m, **water resistance** value of the coated films is .gtoreq.90, discoloration value is .ltoreq.10 after melt molding, and haze change is .ltoreq.20% after heating. Thus, 211 parts 1,4-butanediol and 270 parts ethylene glycol were transesterified with 345 parts di-Me terephthalate and further esterified with 14 parts fumaric acid and 160 parts sebacic acid to give a polyester, 75 parts of which was treated with 15 parts maleic anhydride and 10 parts styrene in MEK/Me2CHOH in presence of azobisdimethylvaleronitrile, mixed with MeOH, further mixed with H2O and Et3N, and freed of MEK, Me2CHOH, and excess Et3N to give a H2O-dispersible graft resin. A particle-free PET film was both-side coated with an aq. dispersion of the graft resin contg. Me2CHOH, anionic surfactant, propionic acid, and colloidal SiO2 (Snowtex OL), dried at 130.degree., stretched, and **heat-set** to give a product showing cross-cut adhesion to a hard coating 100/100, good **water resistance**, the haze change 8.3%, and good recyclability.

AB **Water-resistant** hygroscopic **fabrics** are  
prepd. by treating one side of **fabrics** with  
**waterproofing** agents, adhering together two treated sides of the  
**fabrics** and treating the two untreated exterior sides of the  
laminated **fabrics** with plasma radiation. A woven cotton twill  
was scoured, **bleached**, mercerized, dyed, treated with a soln.  
contg. 50 g/L Asahiguard AG-415 (F-contg. **water**  
**repellent**) and 30 g/L Meikanate MF (blocked isocyanate) to pickup  
65%, dried, and **heat-treated** 3 min at 150.degree.. Two of the  
treated **fabric** were laminated and exposed to plasma radiation on  
the untreated sides for 90 s at 7 kW to give a **fabric** showing  
**water repellency** rating (JIS L-1092) 5 initially and 3  
after 10 washings and water absorption value (JIS L-1907-B) 43 and  
exhibiting good retention of handle.

NOVELTY - The chambers separated by a frangible membrane contain the absorbent articles such as cotton bud, sanitary tampon, and act as a substrate reservoir. The frangible membrane allows contact between the materials in chambers, without opening the packaging system.

DETAILED DESCRIPTION - The packaging system has chambers for housing the absorbent materials such as cotton bud, sanitary tampon, shampoo, coloring or conditioners, medicament and lubricant such as extracts of sea algae. The frangible membrane is pressure or heat crimped at a temperature of 120-160 deg. C, by applying a pressure of 10-20 psi, in 0.5-1.5 seconds to a depth of 2-10 mm. The frangible membrane is provided with tearable or weak line to facilitate opening of chambers. A piston or plunger is provided to slide within the chamber to drive the tampon out of the applicator, and a fastener is provided for releasably securing the package which is an adhesive coated tab with relatively strong and weak adhesives at the ends, in a folding arrangement.

INDEPENDENT CLAIMS are included for the following: (i) Intravaginal delivery method of a lubricant or medicament; (ii) Treating method of a vaginal disorder; (iii) Application of KY-Jelly in the manufacture of a sanitary article packaging system; (iv) Delivery method of two separate mixable components; (v) Usage method of foodstuff in the manufacture of a prefilled foodstuff sachet system; (vi) Application of an adhesive monomer/polymerization initiator in the manufacture of a prefilled adhesive sachet system; (vii) Packaging system manufacturing method; (viii) Sanitary article package manufacturing method which involves heat or pressure crimping two strips of a laminate material along longitudinal edge and placing a sanitary article and a material in respective chambers. Again, the strips are crimped along another longitudinal edge and finally cut to produce a sanitary article; and (ix) Sanitary article packaging system.

USE - To separate housed components for e.g. acrylic adhesives, in treatment of vaginal disorders including bacterial, microbial, fungal and parasitic infections or related medical disorders, for food products such

as yoghurts, fruit sauce, bread sticks and dip, sausages and dips, cake or biscuit bar and cream, chocolate or fudge sauce, e.g. ice cream, desserts with fruit, chocolate or fudge sauce, potato chip and dip, corn chips and dip, for absorbent articles e.g. sanitary articles or **cotton** buds etc., dry, absorbent sanitary product e.g. catamenial tampon, housing sanitary article such as medicaments which include anti-microbial agents such as **triclosan** or chlorhexidine or anti-fungal agents such as clotrimazole, also includes homeopathic medicines or aromatherapy materials, cosmetics, drugs, hormones and lubricants which include extracts of sea algae such as alginates, exudates of plants, such as tragacanth, extracts of plants such as pectins, and derivatives such as dextrans, derivatives of cellulose such as methyl, cellulose, fatty substance such as mono, di, triglycerides of higher saturated fatty acids, ethoxylated products such as polyethylene glycol 200-4000, hydrocarbons such as paraffin oils, polymers such as polyvinyl alcohols, alcohols such as ethylene glycol, emulsifiers such as alecithin, cellulosic polymers e.g. KY-Jelly.

ADVANTAGE - As the frangible membrane is capable of collapsing or tearing, breaking, bursting, cracking or snapping or tearing or breaking down under stress, it allows the materials in chambers to mix or contact.

DESCRIPTION OF DRAWING(S) - The figure shows the side cross-sectional view of the packaging system.

AB US2002042956 A UPAB: 20020906

NOVELTY - A hydrophobic **cotton** fabric (10) is produced by **bleaching** the fabric with an optical **whitener**. The fabric is affixed to a conveying machine. A water resistance solution is applied to the fabric by conveying the fabric through a pad bath (22). The fabric is conveyed twice through a tenter frame machine (24) to effect curing of the chemicals.

DETAILED DESCRIPTION - Production of hydrophobic **cotton** fabric, comprises **bleaching cotton** fabric with an

optical **whitener**. The fabric is affixed to a conveying machine. A water resistance solution (7 lbs) is applied for each 100 lbs fabric by conveying the fabric through a pad bath. The fabric is conveyed through a tenter frame machine having a **heating** chamber set at approx. 340 deg. F, such that the fabric passes through the **heating** chamber (26) at approx. 17 yards/min.. The fabric is conveyed through the tenter frame machine for a second time to effect curing of the chemicals, resulting in a water-resistant **cotton** fabric.

An INDEPENDENT CLAIM is included for a process for producing nylon fabrics or blends containing nylon with polyester, polypropylene, **cotton**, rayon or wool, having hydrophobic and antimicrobial properties, comprising applying approx. 3 lbs of antibacterial substance and 2 lbs of water repellant for each approx. 100 lbs of fabric by conveying the fabric through a pad bath; and conveying the treated fabric through a tenter frame machine having a **heating** device set for approx. 325 deg. F at approx. 40 yards/min..

USE - The method is used for producing water-resistant **cotton** fabric. The fabric is used as undergarments for those suffering from incontinence; feminine shields; bedding products, e.g. mattress pads and covers; and apparel such as t-shirts, lingerie, and medical gowns.

ADVANTAGE - The method produces fabric that preserves hygienic freshness. The fabric remains hydrophobic for extended periods and numerous machine washings.

DESCRIPTION OF DRAWING(S) - The figure shows a fabric conveying and processing apparatus.

AB A laminated films comprise a polyester base film layer and .gtoreq.1 covering layer having a water-sol. or a water-dispersible resin as a main component, where the laminated films have a value for the **resistance to water** of .gtoreq.90%, a value for discoloration after the melt molding thereof of .ltoreq.10 and the change in a haze value after heating of .ltoreq.20%. Thus, prepg. a polyester contg. di-Me terephthalate 33, di-Me isophthalate 33, sebacic acid 30, fumaric acid 4, 1,4-butanediol 60 and ethylene glycol 40 mol%, heating 75 parts the polyester with MEK 56, i-PROH 19 and maleic anhydride 15 at 65.degree., adding styrene 10 and AIBN 1.5 dissolved in MEK 12 parts, polymg. and working up gave a graft copolymer with acid no. 1400 equiv/ton. Mixing 40 parts a 25% aq. dispersion of the graft copolymer with water 24, i-PROH 36, propionic acid 1 and an anionic surfactant 1% and a colloidal silica (5% based on resin solids), coating the resulting mixt. on 2 surfaces of a longitudinally-stretched PET polyester film to dry pickup wt. 0.6 g/m2, drying at 80.degree. for 20 s, stretching 4:1 on a tenter at 120.degree. and heating the coat film at 260.degree. for 0.5 s and at 200.degree. for 23 s to give a coat film with good claimed properties.

ST **water resistance** laminated PET polyester film; vinyl grafted unsatd polyester water miscible coating film; isophthalic terephthalic acid polyester vinyl grafted water sol coating; maleic anhydride copolymer polyester coating laminated film; adhesiveness improver coating vinyl grafted polyester coating; **whitening resistance** coating polyester film

AB An **whitening**-free interior or exterior finishing clay-based material with superior **water resistance** and refractory behavior is **fabricated** at low temp. without sintering. The clay-based article, similar to an unglazed ceramic plate, is prepd. by molding and drying a mixt. of 40-60 wt.% clay-based material( such as kaolin and/or sericite), 11-29 wt.% liq. resin strengthening agent and 14-17 wt.% disperse soln. of 4-9% aluminum silicate in 4% polyethylene glycol aq. sol. as wt.-reducing agent and 5-6 wt.% of 2% pentaerythritol aq. sol. before hardening with a 110-150.degree.C **heat** treatment. The fired molded products have sandstone appearance with good bending strength and **water resistance**.

NOVELTY - An antibacterial cotton and its manufacture are provided, which is characterized by protecting a body from ticks and mould, removing a bad-smell, radiating bio-far infrared ray and controlling thermal decomposition, and is useful for an antibacterial counterpane, an antibacterial undergarment, an antibacterial carpet and so on.

DETAILED DESCRIPTION - The antibacterial cotton is obtained by a process containing the steps of: feeding polyester type fiber containing 10-40wt.% of low melting fiber by a transfer fan to an auto hopper; opening the polyester type fiber with a brine cylinder, a dart

roller, a stripper roller and a worker roller, followed by spraying inorganic antibacterial agent added with an adhesive on a doffer; mixing 25% of water and 75% of the inorganic antibacterial agent into a tank with a mixing driving motor, followed by spraying the mixed inorganic antibacterial agent to the polyester type fiber; opening more fine through a comb, and mixing the opened fiber and the inorganic antibacterial agent; drying moisture of the antibacterial agent, and heating at 160-230 deg. C to melt the low melting fiber, so infiltrating the inorganic antibacterial agent into the inside of the melted fiber; extruding on a chip type anti-bacterial cotton at high temperature; cooling by an air supplying method; and then finishing the chip type antibacterial cotton on proper shape and size.

CC 40-9 (Textiles and Fibers)

AB The microfiber knitted pile fabrics treated by antimicrobial finish (com. tin and phenol compd.) was studied. Two kinds of split-type nylon/polyester microfiber fabrics and one conventional filament fabric were treated with the solns. at various concns. by pad-dry process. Antimicrobial activity, durability, and water-related transport properties of the finished fabrics were analyzed. Antimicrobial activity of the finished fabrics was evaluated by bacterial redn. (%). Excellent antimicrobial activity was obtained at very low concn. but the microfiber fabric pretreated with water-oil repellent agent showed antimicrobial activity at high concn. due to low % add-on. Microfiber fabrics finished at the specific concn. showed good durability to repeated laundering compared with the conventional filament fabric. No curing process at high temp. was necessary because a simple drying of the padded fabric at 50 .degree.C gave excellent durability to laundering. Also, durability to dry cleaning and bleaching, and stability to the heat of the finished microfiber fabrics were excellent. Intrinsic water-related properties of microfiber fabrics were little changed after antimicrobial finish. Therefore, the multifunctional microfiber fabrics with high

water absorption and antimicrobial property were developed, which is good for hygienic end-use.

 AB Title films with no wrinkle by shrink, useful for labels and caps with no whitening or breakage by retort treatment, are made of polyesters with Tg 40-60.degree. (Tg = glass-transition temp.) and m.p. .gtoreq.150.degree. which comprise mainly butylene terephthalate and 20-55 mol% other acid and glycol components. Thus, a mixt. of 51% di-Me terephthalate, 27.2% 1,4-butanediol (I), and 21.8% bisphenol A ethylene oxide adduct (II) was polymd. to obtain polyester with Tg 49.degree. and m.p. 170.degree. comprising 100% terephthalate in acid component and 75% I and 25% II in glycol component. Its double-axially drawn film showed good size stability with heat shrinkage 53% (100.degree. for 1 min).

NOVELTY - Imparting long-lasting antimicrobial properties to a fabric by  
contacting **triclosan** ester derivative.  
DETAILED DESCRIPTION - Imparting long-lasting antimicrobial  
properties to a fabric comprises:

*check out  
triclosan*

(a) providing at least one triclosan ester derivative; and  
(b) contacting the triclosan ester derivative with a textile at a temperature and for a period of time sufficient to effectuate the diffusion of the triclosan ester derivative within the individual fibers of the textile; in which the textile comprises man-made fibers; and the textile to triclosan ester derivative weight ratio is within 100:03 to 100:1.

ACTIVITY - Antimicrobial; Germicidal; Fungicidal. Equal amounts of triclosan acetate (2,4,4'-trichloro-2'-acetoxy-diphenyl ether) and Triton (RTM) X-301 were introduced to a flask under stirring. Upon addition of 50 wt.% water to the mixture, a stable dispersion of triclosan acetate was obtained at a content of 50 wt.%. The dispersion was then introduced to a jet dyeing machine. A 50 / 50 nylon / lycra blend knit fabric was then added such that the wt.% ratio of fabric to ester was 100:0.1. The machine was then closed, agitated, heated to 120 deg. C for 20 minutes, then cooled to room temperature. Then the fabric was removed, dried and analysed for its antimicrobial properties. The fabric showed 100% contact inhibition and a 3mm zone of inhibition when tested against Staphylococcus aureus. The fabric was then subjected to an equivalent of 25 standard home washes and the fabric retained the same level of contact inhibition and showed a 1mm zone of inhibition against Staphylococcus aureus.

MECHANISM OF ACTION - None given.

USE - The process imparts long-lasting durable antimicrobial, germicidal and fungicidal properties to textiles. The treated fabric may be incorporated into a garment, table linen, bathroom linen, napery linen, bar towel or any other type of fabric where antimicrobial properties are desirable.

ADVANTAGE - The procedure is relatively inexpensive. The fabric retains antimicrobial compounds in it through at least twenty-five laundry cycles (equivalent to one year with washing every other week).

Thus, a 50%-solid propylene glycol monomethyl ether soln. contained a copolymer comprising Silaplane FM 0721 [dimethyl siloxane terminated by OSiMe2C3H6O2CCMe:CH2 on 1 end], Cyclomer A 200, styrene, Et acrylate, and 2-ethylhexyl acrylate at initial reaction ratio 4:80:236:40:40 obtained in the presence of Perbutyl O. A coating contg. Cyacure UVR 6110 100, the soln. 10, UVI 6990 (initiator) 6, and L 7604 1 part was applied onto a PET film-Sin-free steel plate laminate and exposed to UV to give test pieces showing JIS K 5400 pencil hardness 3H, cross-cut adhesion 100/100, and no whitening nor blistering after 30 min in 125.degree.-moisture. A coating on Al plate showed no cracking by du Pont impact test.

AB Title moldings, useful for packagings, etc., are prepd. by thermoforming of oriented sheets of poly(lactic acid)-based polymers with facial orientation  $\Delta P$  3.0 times. 10-3-30 times. 10-3,  $\Delta H_m - \Delta H_c$   $\geq 20$  J/g, and  $(\Delta H_m - \Delta H_c) / \Delta H_m \geq 0.75$  ( $\Delta H_m$  = heat of crystal melting in sheets during heating;  $\Delta H_c$  = heat of crystn.). Thus, 98:2 L-lactic acid-D-lactic acid copolymer was extrusion-molded to give a sheet [ $\Delta P$  10 times. 10-3,  $\Delta H_m - \Delta H_c$  50 J/g,  $(\Delta H_m - \Delta H_c) / \Delta H_m$  0.95], which was biaxially drawn and thermoformed to give a cup showing good impact strength and prevention of whitening or distortion after 24 h at 80% relative humidity and 50.degree..

AB Sterilization of instruments is very important in endodontic treatment, though time and labour are needed for sterilization. If instruments which have high frequency in use such as reamer and file could be sterilized in a short time near the dental chair, efficiency of treatment would certainly increase. So this study was performed to compare the effect of four kinds of simple dry sterilizer by using the K-type file with bacterial contamination. Simple dry sterilizers used were NI electric drying apparatus (here in after 'NI'), SL sterilizer ('SL'), KING FISHER 21 ('KING'), and Bizu 260K ('BIZU'). As for the SL, two parts (slit and hole) were used. The species of bacteria were Enterococcus faecalis, Staphylococcus aureus, Pseudomonas aeruginosa and Bacillus subtilis. Each species was prepared to  $2.0-8.0 \times 10^7$  (herein after  $\times 10^7$ ) and  $2.0-8.0 \times 10^4$  ( $\times 10^4$ ). Following the measurement of the temperature in each sterilizer, #15 and #45K-type files which were previously immersed in bacterial liquid were put in each sterilizer for 3, 5, 10, 15, 30, 60, and 90 seconds. Then they were cultured in Tryptic Soy Broth for 24 and 48 hours, and macroscopic observation was performed. The results were as follows: (1) Time for disappearance of bacteria on #45K-type files was longer than that on #15K-type files. (2) When the number of bacteria was  $\times 10^4$ , time for disappearance was quite shorter in comparison with  $\times 10^7$ . (3) Among the sterilizers, BIZU and SL (slit and hole) showed a relatively good result. (4) Bacillus subtilis needed a long time for disappearance compared to other species in each sterilizer. In the clinical use of these sterilizers, if the number of bacteria are decreased beforehand by wiping with alcohol cotton, etc., sterilization may be finished within 10 seconds. (author abst.)

AB JP 05132873 A UPAB: 19931118  
Agent contains fluorosilicone type cpd. of formula (I), its hydrolysate, hydrolysis condensate and/or their mixt. as the effective component. In (I), R1 = H or CH3; R2, R3 = trimethylsilyloxy, 1-4C alkyl, alkylcarbonyloxy or alkoxy; RF = -(CF2)n1X or gp. of formula (Ia); X = H, F or Cl; n1 = integer of 1-10; n2 = integer of 0-8; m = integer of 1-10; l

= 0 or 1 but R1 is H when l is 0.

USE/ADVANTAGE - The fibre treating agent is applied of various kinds of fibre prods. made of natural fibre, synthetic fibre, semi-synthetic fibre, blended fibres, etc. The treating agent imparts good water repellent properties, oil repellent properties, feeling, anti-staining effect, etc. to fibre and has good weather resistance and washing resistance.

In an example, 10g cpd. of formula (41) was put in 100g acetone and 0.2 g aq. 30 wt.% HCl soln. added under stirring and then heated in a N2 gas atmos. under reflux for 2 hrs. The reaction mixt. was neutralised with 2.0g propylene oxide and filtered. The filtrate was distd. under vacuum to obtain hydrolysis condensate as deposit. The deposits were dissolved in a mixed CF2CF2CHCl2 and CClF2CF2CHClF (1:1 by wt.) soln. in a concn. of 1 wt.% to obtain a treating soln. Polyester/cotton broad cloth (65/35) was dipped in the treating soln. at 100 deg.C for 2 mins. and at 170 deg.C for 2 mins. The fabric had good water repellent properties, 100, good oil repellent properties, 100 and good feeling, 22.3, c.f. 0, 0, and 16.6, respectively, for the untreated polyester/cotton broad cloth.

AB	Laminates with good humidity resistance and insulating properties are				

prepd. by heating reactive MeO- or EtO-contg. organopolysiloxanes and bisphenol epoxy resins in the presence of p-Me-C6H4SO3H (I) in CO2 gas, blending the products with phenol novolak resin crosslinkers, impregnating base materials with the varnish thus obtained to give prepregs, drying, stacking, and press molding them. Thus, a mixt. of phenylethoxypolysiloxane 100, Epon 828 50, and I 2 g (in 1 mL H2O) was heated at 160.degree. for 90 min in CO2 to obtain a resin, which (100 parts) was mixed with 10 parts phenol novolak resin and MEK to give a varnish. Glass clothes (0.18-mm) were impregnated with the varnish and dried to obtain prepregs (45% solids), and 8 of them were stacked and press molded to give a laminate showing insulative resistivity 2 .times. 1010 .OMEGA., no change in toluene for 30 min, heat distortion temp. 160.degree., excellent punching processability at 40-60.degree., vs. 2 .times. 108, whitening, 125, bad, resp., for a laminate using a varnish prepd. from 100 parts silicone resin, 0.1 part N(C2H5OH)3, and Me2CO.

AB A method of pretreatment of cellulosic fibers comprises initially treating the fibers with a soln., dispersion, or melt of reagent I (HZR = OH-contg. compd. or amine; R = alkyl, aryl, aralkyl, or a chain having .gtoreq.1 polymerizable double bond) and in the second step treating the fibers with an alk. reagent combined with a heat treatment. The pretreated fibers are useful as reinforcements in the manuf. of composites. Thus, **bleached** kraft pulp fibers were impregnated with a 0.5% CHCl<sub>3</sub> soln. of II, dried, treated with 0.05M NaOH, **heat-treated** at 90.degree. for 30 min, washed, and dried. The contact angle of H<sub>2</sub>O on paper from the treated pulp was 120.degree., compared with 0.degree. for untreated paper.

AB Heat-sensitive recording materials with recorded images highly  
 resistant to high humidity conditions are prep'd. by coating a support with  
 a compn. comprised of a color former, a color developer, and .gtoreq.1 of  
 a water-sol. binder and a water-dispersible binder and irradiating the  
 coated recording layer with an electron beam. Images recorded on the  
 materials exhibit superior stability and the moistened recorded images do  
 not fade when rubbed with the fingers. Thus,  
 3,3-bis(p-dimethylaminophenyl)-6-dimethylaminophthalide 10, a 5% aq. soln.  
 of poly(vinyl alc.) (deg. sapon. 98% and d. p. 1100) (I) 10, and H2O 15  
 parts were mixed to give a dispersion (A). 4,4'-Isopropylidenediphenol  
 20, a 5% aq. soln. of I 10, and H2O 40 parts were also mixed to give a  
 dispersion (B). Then A 35, B 70, CaCO3 25, an anhyd. SiO2 powder 25, and  
 a 15% aq. soln. of I 270 parts were mixed, coated on a paper support at  
 5.0 g/m2 (dry), irradiated with 2 Mrad of an electron beam (acceleration  
 voltage of 170 KV), and dried to give a heat-sensitive recording  
 paper. The recording paper was imaged in a facsimile app. to give a color  
 d. of 1.30. The color d. was reduced to 1.07 when the recorded paper was  
 stored at 40.degree. and 90% relative humidity for 50 h. The recorded  
 images also showed good water resistance.

AB	<p>SU 1034680 A UPAB: 19930925 Various <b>fungicides</b> at present in use against <b>cotton</b> wilt caused by Verticillium dahliae are not very effective. The patent proposes the use for this purpose of various crown ethers of the general</p>				

formula (I), where R and R1 are H, C3H7, C5H11, COCH3, COC4H9.

Crown ethers (I) are sparingly sol. in water; they are dissolved in pure ethanol, 0.1-0.2 ml 'Tvin-40' is added and alcohol is removed in vacuo with gentle heat. Pure water is then added to give a 1-5.10 power minus 3M soln. of (I). The detergent 'Tvin-40' does not itself stimulate the resistance of cotton plants to wilt. The infection process is monitored by UV determination of isohemigossipol, isolated by thin layer chromatography. Cotton plant seeds protected with (I) show a 2.2 fold increase in wilt-resistance. A typical example of (I) is diacetyl dibenzo-18-crown-6. The cotton harvest is improved on average by 14%. Bul.30/15.8.83

AB JP 57117673 A UPAB: 19930915

Fabric made of a blend composed of polyester-polyurethane elastic fibre  
and other fibre (especially polyamide-, polyester-, or **cotton**  
fibre) is mildew-proofed by **treating** with a liq. contg. a  
sulphamide of formula (I), and then **heat-treating** at 80 deg.C or  
higher. In (I) A is sulphaamide or N-substd. sulphaamide, esp. a group of  
formula R1R2N-SO2- where R1 and R2 are each H or lower alkyl; and B is  
aromatic group which may have substit. attached to the nucleus.

In an example, nylon/polyester-polyurethane blend tricort fabric was  
immersed in an emulsion containing 0.5 wt.% of N-dimethyl-N'-phenyl-  
(N'-fluorodichloro methylthio)- sulphamide, 6 wt.% of trimethylbenzene and  
3.5 wt.% of surfactant, squeezed to 40% pickup, dried at 120 deg.C for 3  
minutes, and cured at 180 deg.C for 1 minute.

Sufficient mildew-proofness is obtd. without using  
organometallic-compound-based **fungicide**.

**Cotton** fabrics are printed by screen or roller printing with a  
printing paste which contains cold type reactive dye or azo dye and  
**water repellening** agent for ripple finish. The fabrics  
printed with the above dye may be printed with a **water**  
**repelling** agent by the use of another stencil which matches the  
printed pattern.

After drying, the printed fabrics are treated with steam **heat**  
at 98-102 degrees C for <20 mins. - pref. 20 secs. to 2 mins. for reactive  
dye and 3-10 mins. for azo dye - or with dry **heat** at 120-180  
degrees C for <5 mins., pref. 20 secs. to 3 mins.

The fabrics are then treated with soln. of caustic soda at a concn.  
of 20-38, pref. 28-35 degrees Be and at 0-30, pref. 10-20 degrees C. The

fabrics are left in the air for <20, pref. 3-8 mins., neutralised and dried.

The cotton fabrics are calico, poplin, etc. of coarse texture and they are subjected to pretreatment such as singeing, desizing, scouring, **bleaching**, etc. The **water repellening** agent is used solely or in combination with resin.

- AB The reaction of ethylenimine (I) and Et perfluorooctoate (II) was studied by using ir spectroscopy. The ester consumption was nearly complete at a I/II mole ratio of 3:1. Solns. contg. I and II in this ratio in 2-ethoxyethanol as solvent, were used to treat cotton **fabrics**. Samples dried at 80.degree. without **heat** cure had good hand and high oil repellency and remained white, while those cured at .gtoreq.120.degree. were yellowed. **Water repellency** was .ltoreq.50% for all treatments. The durability of the finish fell off after 10 launderings or 5 hrs. extn. with perchloroethylene, for add-on levels of <5%. The treating solns. were reused after 12-29 days aging at room temp. **Fabrics** treated with these solns. were not yellowed,

and oil repellency and durability were nearly as good as for fresh solns. The reflectance of treated samples was affected only slightly by exposure to natural light. Discoloration from Cl bleaching and (or) scorching was removable with NaBH<sub>4</sub> or NaBO<sub>3</sub>. Light-microscope examn. of Hardy sections of stained, treated fibers indicated that polymer deposition occurred randomly, mainly in the fiber lumens and immature fiber walls. The treatment did not increase the resistance to microbiol. degradation. Et perfluorobutyrate was used in expts. as above, but gave much lower oil repellency. The phys. properties of fabric padded to 85% pickup in a 3% II-0.9% I soln., dried at 180.degree.F. for 5 min., and after washed 30 min. were detd. AB Textile materials, esp. hydrophobic fibers, are treated with substituted tertiary amines to make them antistatic and resistant to laundering and dry cleaning. To achieve these properties, polytertiary amines are used, prepd. by reaction of an aliphatic primary monoamine with an alkylene or aralkylene glycol diester and (or) other diesters, e.g. of polyethylene glycol, in the presence of an acid acceptor. Finally, the impregnated textiles are dried and heated to make them insol. by cross-linking with tertiary or polytertiary amines. This treatment also makes the fibers absorb and fix acid dyes. For example, an antistatic finish was prepd.

from MeNH<sub>2</sub> 17.85, polyethylene glycol dichloride (mol. wt. 600) 366, ethylene glycol 385, and anhyd. Na<sub>2</sub>CO<sub>3</sub> 121 parts in a glass-coated autoclave by heating for 3 1/2 hrs. at 128.degree. and 2.4-3.2 kg./cm.<sup>2</sup> internal pressure. After cooling at 80.degree., 800 parts H<sub>2</sub>O were added to sep. the salts in the aq. layer by standing for 1 1/2 hr., then 453 parts salt contg. H<sub>2</sub>O were gradually removed and the same amt. of H<sub>2</sub>O added to make up a 20% active soln. of the polytertiary amine (I). Undyed, **bleached** polyester taffeta was impregnated with I 40 and polyethylene glycol diiodide 2.2 in H<sub>2</sub>O 100 parts on a 3-roll dyeing machine, dried for 2 min. at 90.degree., and **heat-treated** for 3 min. at 150.degree.. The antistatic effect resists > 70 launderings.

- PRAI GB 19611124
- AB Improved stabilization of polyamides to **heat**, light, and repeated washings is described. For this purpose, a combination of a thermally stable quinone, a salt or ester of an org. O acid of P, a Min salt, and an org. dibasic or monobasic acid or anhydride is used. For example, fibers are drawn from a polyamide compn. contg. 5 kg. poty(hexamethyleneadipamide), 47.3 g. TiO<sub>2</sub>, 4.3 g. optical **bleach** (Uvitex MP), and 2.15 g. di-tert-butyl-2,5-hydroquinone, 4.3 g. NaH<sub>2</sub>PO<sub>2</sub>, 0.645 g. Mn lactate, and 23.65 g. Bz<sub>2</sub>O as stabilizer, and 30 p.p.m. Mn. The relative viscosity is 31.5, the tensile strength 5.9 g./denier, and the ultimate tensile strength 27.6%. After heating at 225.degree. or after exposure to ultraviolet light, no discoloration is found. A control sample contg. 1.1% TiO<sub>2</sub> and 0.17% HOAc as stabilizers has a relative viscosity of 32.2, a tensile strength of 5 g./denier, and an elongation at break of 27.1%. These fibers slowly changed from pure white to yellow when heated or irradiated. The absence of any one of the 4 stabilizer components renders the resulting combination less effective.

	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	US 2721784		19551025	US	
AB	Cellulose fibers react with .beta.-propiolactone (I) vapor, or I dissolved in a water-immiscible solvent, e.g. xylene, with or without acid or basic catalysts, to increase thickness, impart resistance to dyes, heat, and wrinkling, and decrease affinity for water and polar compds. with no decrease in tensile strength. Esterification is the preferred reaction, which predominates when treatment is made with I in soln., e.g. xylene. Etherification predominates when I vapor is used. In general, etherification is favored by use of acid or no catalysts, while esterification is favored by basic catalysts. The use of yarn, thread, or fabric of bleached, mercerized cotton is preferred. For example, 3 skeins of 12/5 cotton thread were soaked in 2% solns. of monoammonium phosphate, diammonium phosphate, and oxalic acid, resp., centrifuged to about 100% wet pick-up, dried at 60.degree., and refluxed in 500 ml. xylene contg. 60 g. I for 15 min. The treated samples were extd. with acetone. Wt. gains after extn. were 22.5, 23.9, and 19.1%, resp.; and carboxyethyl contents were 11.7, 12.5, and 9.7%, resp. With NaOH as catalyst and 10-min. refluxing, the wt. gain was 31.5% and the carboxyethyl content 13.9%.

AB Treatments of textiles, similar to those used in mills and laundries, changes the bactericidal properties and the retention, absorption, and permeability of the **fabrics** to body **heat**, water, and sweat. Wool **cloth** was chromated or chlorinated at different pH values and concns. and sterilized in steam. The wool was then wetted and cultures of skin bacteria, especially *Micrococcus pyogenes* var. *aureus*, grown on it for 2 weeks and the damage noted. Chromation after but not before the chlorination reduced damage to the wool. The chromation was effective if the solns. used had 0.1% chromate or more. Chromation or chlorination at low pH caused more damage than treatment at pH 5 or 7. Repeated **bleaching** or washing of linen at 100.degree. reduced the humidity transfer across the **fabric** and increased the water-absorption of the fibers, while washing at 85.degree. had little effect. Halflinen and cotton were more resistant to damage caused by washing or **bleaching** at 100.degree.. Impregnation of poplin for **water-repellency** improved the **heat** retention of the body. Synthetic polyamide fibers (Perlon) chromated up to pH 7.5 absorbed Cr, the amt. increasing with decreasing pH. The chromated Perlon showed less swelling than the untreated material.

AB Tentative specifications are given for C-steel car and tender axles, structural Si steel, C-steel castings for valves, flanges and fittings for high-temperature service, alloy-steel bolting material for high-temp. service, W powder, spiegeleisen, ferro-Mn, ferro-Si, ferro-Cr, ferro-V, hollow staybolt Fe, Al base alloy sand castings, bronze trolley wire, Muntz metal condenser tube plates, Al ingots for remelting, non-ferrous insect screen cloth; for quicklime for use in the manuf. of sulfite pulp, quicklime for use in water treatment, hydrated lime for use in water treatment; for preservative coatings including raw tung oil, dry bleached shellac, Fe oxide and Fe hydroxide, lithopone, lampblack, boneblack, chrome yellow, pure chrome green, reduced chrome green; for high-C tar cement for use cold in repair work, high-C tar cement; for water-proofing materials including acid-resisting asphalt mastic, smooth-surfaced asphalt roll-roofing, slate-surfaced asphalt roll-roofing and slate-surfaced asphalt shingles, asphalt-satd. roofing felt for use in **waterproofing** and in constructing built-up roofs, coal-tar satd. roofing felt for use in **waterproofing** and in constructing built-up roofs; for textile materials including textile testing machines, tolerances and test methods for cotton yarns, single and plied, tolerances and test methods for cotton sewing threads, tolerances for numbered cotton duck, tolerances and test methods for knit goods; for sieves for testing purposes. Tentative methods are given for sampling ferro-alloys; chem. analysis of ferro-alloys, chem. analysis of Al and light Al alloys; chem. analysis of limestone, quicklime and hydrated lime, securing specimens of hardened concrete from the structure; testing shellac varnish, routine analysis of white linseed oil paints; test for distn. of gasoline, naphtha, kerosene and similar petroleum products, for distn. of natural gas gasoline, for penetration of greases, for viscosity of petroleum products and lubricants, for color of petrolatum by means of the Union Colorimeter, for burning quality of long-time burning oil for railway use, for neutralization no. of petroleum products and lubricants, for cloud and pour points of petroleum products, testing gas oils (gravity, distn., S, C residue, pour point, viscosity, water); mech. analysis of subgrade soils, test for the detn. of moisture equiv. of subgrade soils in the field, test for consistency of port.-cement concrete, float test for bituminous material; test for absorption of slate, flexure testing of slate (detn. of modulus of rupture and modulus of elasticity); testing felted and woven **fabrics** satd. with bituminous substances for use in **waterproofing** and roofing, testing bituminous mastics, grouts and like mixts.; testing smooth-surfaced asphalt roll-roofing, slate-surfaced asphalt roll-roofing and slate-surfaced asphalt shingles; testing of insulating varnishes, of elec. insulating materials for voltage effects at radio frequencies, of cable splicing and pothead compds., of untreated insulating paper, of laminated sheet insulating materials, of grease wool

and allied fibers for scoured content; tension testing of metallic materials, compression testing of metallic materials, Brinell hardness testing of metallic materials. Tentative recommended practice is described for carburizing and heat treatment of carburized objects; thermal analysis of steel. Tentative definitions are given of terms relating to the gypsum industry, the term sand; terms relating to coal; terms relating to methods of testing, terms relating to sp. gr., the term screen (sieve). Under the heading "Tentative revisions of A. S. T. M. standards" standards specifications are given for C-steel and alloy-steel forgings, quenched-and-tempered C-steel axles, shafts and other forgings for locomotives and cars, C-steel forgings for locomotives, quenched-and-tempered alloy-steel axles, shafts and other forgings for locomotives and cars, C-steel car and tender axles, welded and seamless steel pipe, lap-welded and seamless steel and lap-welded Fe boiler tubes, welded wrought-Fe pipe, staybolt, engine-bolt and extra-refined wrought Fe bars, malleable castings, Lake Cu wire bars, cakes, slabs, billets, ingots and ingot bars, electrolytic Cu wire bars, cakes, slabs, billets, ingots and ingot bars, light Al casting alloys, high-strength bronze trolley wire, round and grooved, 40 and 65% cond., seamless admiralty condenser tubes and ferrule stock, high sheet brass, naval brass rods for structural purposes; specifications and tests for port. cement, cement-concrete sewer pipe, fire tests of materials and construction, paving brick, hydrated lime for structural purposes; turpentine; broken slag for waterbound base and wearing course; shovel-run or crusher-run broken slag for waterbound base. Recommended practice is described for heat treatment of case-hardened C-steel objects. Standard methods are given for testing gypsum and gypsum products; test for distn. of bituminous materials suitable for road treatment, lab. sampling and analysis of coke, lab. sampling and analysis of coal, sampling and analysis of creosote oil, testing molded insulating materials. Standard definitions are given of terms relating to paint specifications.

AB Certian of the ingredients emploeyed for sizing warp yarns exert very injurious effects upon the cloth in some of the subsequent processes, e. g., singeing, **bleaching**, dyeing and printing. A moist atm. and a certain amt. of moisture in the yarn are practically essential to ensure good results in the weaving. To prevent mildew in sized warps the sizer in corporates a small amt. of  $ZnCl_2$ ,  $MgCl_2$  or  $CaCl_2$  with the size, which acts at the same time as an antiseptic and as a deliquescent. All these chlorides tend to dissociate at high. temps., and **cloths** containing them are liable to become tendered after passing

through the singeing process. The **heat** of the singeing machine liberates HCl which destroys the fibers of the **cloth**. The irregularly distributed damaged parts betray themselves in the form of holes with clean cut edges, distinct from the frayed edges of mechanically damaged parts. Another objectionable substance often used in sizing is paraffin wax, the object being to lubricate the sized threads for the weaving process. Tallow is the proper substance to employ for this purpose, but paraffin is used either because it is cheaper or in the form of adulterated tallow. Paraffin wax and similar unsaponifiable substances are not emulsified in the b. processes to which the goods are subjected preparatory to **bleaching** or dyeing. The wax is simply loosened, floats to the top of the kier and settles on the goods in the form of patches producing gray **water-resistant** stains which cannot be bleached or dyed. Sometimes the wax remains evenly distributed over the **cloth** without forming patches, in which case the fibers remain absolutely resistant to the calendaring operation and the **cloth** finished up quite limp. Mineral oil stains derived from the lubricating oil of the loom or other machinery are likewise objectionable, and it has been clearly demonstrated that mineral oil stains resist all known processes of **bleaching**, but it would appear that a mixture of vegetable and mineral oils is not so harmful. In the discussion, P. Bean pointed out that the use of deliquescent chlorides is not confined to the object of facilitating the weaving operations.  $MgCl_2$  and  $CaCl_2$  are used illegitimately to increase the wt.; these chlorides attract excess of moisture, enabling the **cloth** to carry more "filling." "Yorkshire grease" has been mentioned as a substitute for tallow, but this is not always safe.
